Dear MyOme Hiring Team,

I am applying for the Bioinformatics Software Engineer role at MyOme. With 4+ years building production-grade NGS and genomic pipelines at scale, including clinical deployment in a CAP-regulated environment, I bring the combination of bioinformatics depth and engineering rigor this role requires.

What draws me to MyOme specifically is the ambition of the platform: delivering whole-genome insights that follow patients throughout their lives, backed by strategic partnerships with Illumina and Natera, and now expanding into long-read methylation analysis. Building the infrastructure that makes that kind of clinical-grade genomics possible is exactly the engineering challenge I want to work on.

My experience maps directly to what you are building:

- Pipeline engineering at scale: At UPenn's Perelman School of Medicine, I designed and maintained Snakemake and Nextflow workflows processing 50,000+ whole genomes on AWS (EC2, S3, Glacier) and SLURM/HPC, with parallelized execution strategies that cut runtime significantly for terabyte-scale datasets.
- Clinical NGS deployment: At Aperiomics, I built and containerized (Docker) a production HPV identification pipeline against a 40,000-genome reference database, with automated QC, reporting, and CAP-compliant validation studies.
- Reproducible, version-controlled systems: All workflows I have built are Git-versioned, modular, and designed for long-term maintainability across teams, with agentic coding tools including Claude Code integrated to accelerate development and review.
- WGS & variant analysis: GATK, PLINK, BCF/VCF, Samtools, Bedtools, cohort harmonization, and genome build liftover are core to my daily work.

I am completing an MSE in Scientific Computing at UPenn (graduating July 2026), which has deepened my software engineering foundations alongside the bioinformatics work. I would welcome the opportunity to bring this background to MyOme's platform team.

I look forward to hearing from you.

Kind regards,

Taha Iqbal
